Organizations Need Software Product Lines Now More Than Ever!

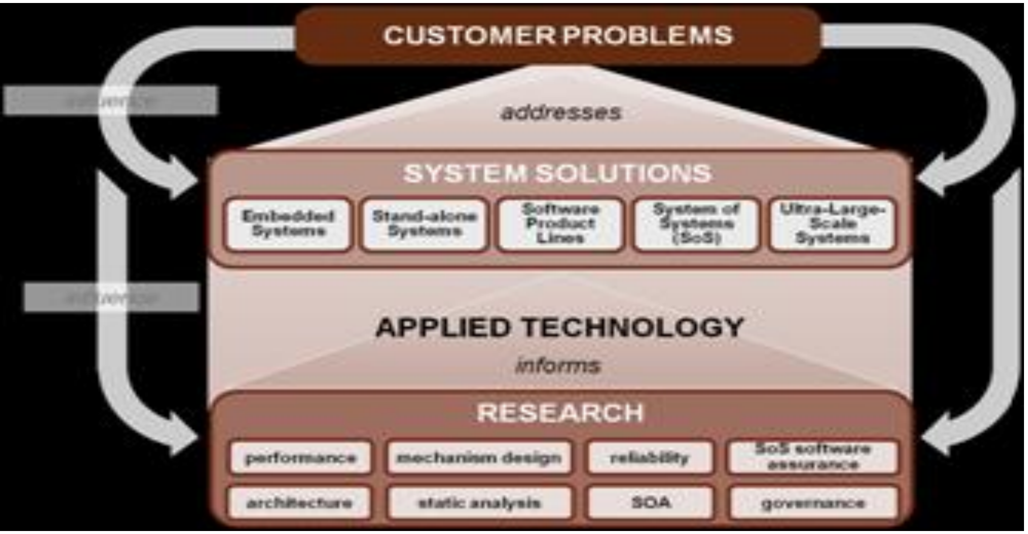
Effectively using software product lines improves time to market, cost, productivity, and quality. They also enable rapid market entry and flexible response. And, using software product lines simplifies software maintenance and enhancement.

Research, Technology, and System Solutions Program: Working with the SEI

If you need to improve …

❖the structure and behavior of your software-reliant systems (regardless of scale)

❖your ability to predict that behavior



The SEI can…

❖harness the appropriate technology to help you solve specific problems

❖help you launch initiatives

❖help you improve your capabilities

❖conduct applied research that meets your needs

❖partner with you to create leading edge techniques, methods, and tools

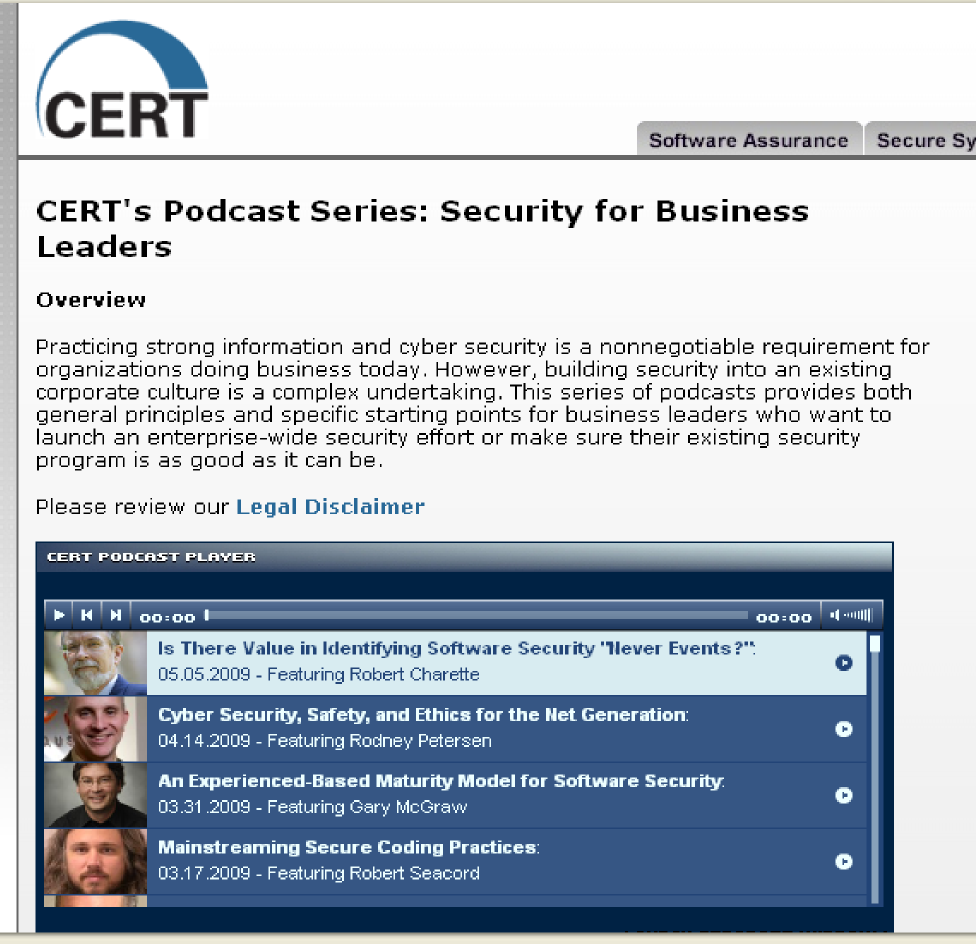
CERT's Podcast Series: Security for Business Leaders.



CERT's Podcast Series: Security for Business Leaders

Overview

Practicing strong information and cyber security is a nonnegotiable requirement for organizations doing business today. However, building security into an existing corporate culture is a complex undertaking. This series of podcasts provides both general principles and specific starting points for business leaders who want to launch an enterprise-wide security effort or make sure their existing security program is as good as it can be.

SEI Webinar Series: Secure Coding

August 18th

Robert C. Seacord

Presenter Bio

Robert Seacord began programming (professionally) for IBM in 1982 and has been programming in C since 1985. Robert leads the Secure Coding Initiative at the CERT, located at Carnegie Mellon's Software Engineering Institute (SEI). He is author of *The CERT C Secure Coding Standard* (Addison-Wesley, 2009), Secure *Coding in C and C++* (Addison-Wesley, 2005), *Building Systems from Commercial Components* (Addison-Wesley, 2002) and *Modernizing Legacy Systems* (Addison-Wesley, 2003).

How did you hear about this webinar?

Secure Coding Initiative

Initiative Goals

Work with software developers and software development organizations to eliminate vulnerabilities resulting from coding errors before they are deployed.

Overall Thrusts

Advance the state of the practice in secure coding

Identify common programming errors that lead to software vulnerabilities

Establish standard secure coding practices

Educate software developers

Current Capabilities

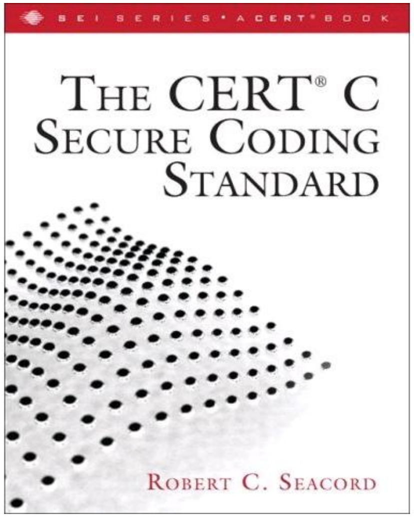
Secure coding standards

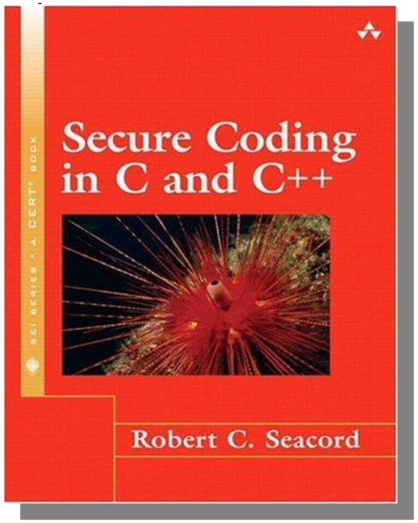
www.securecoding.cert.org

Source code analysis and conformance testing

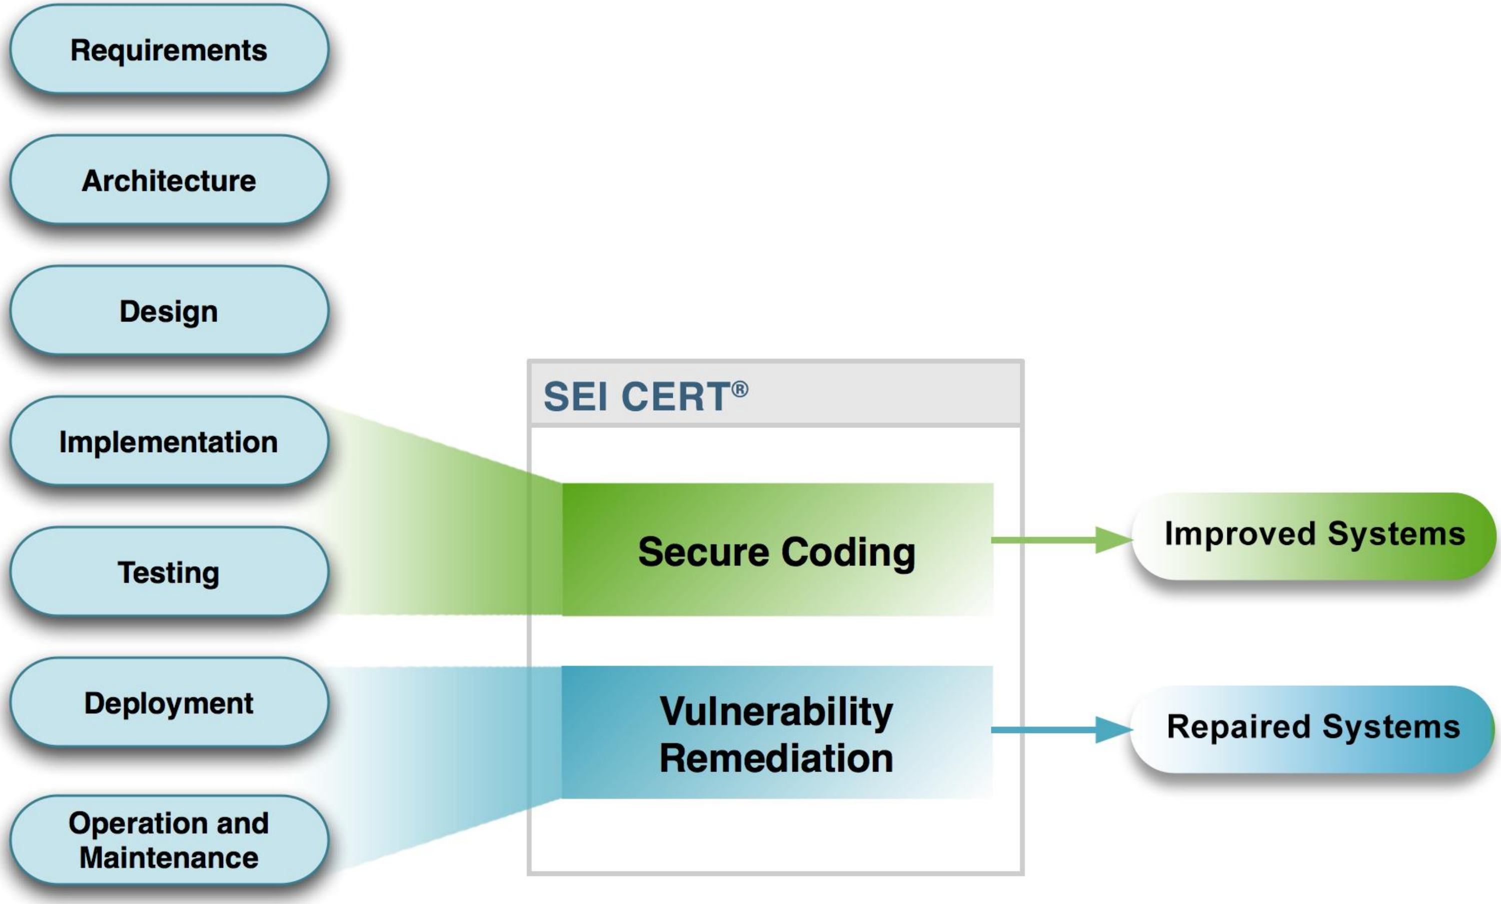
Training courses

Involved in international standards development.



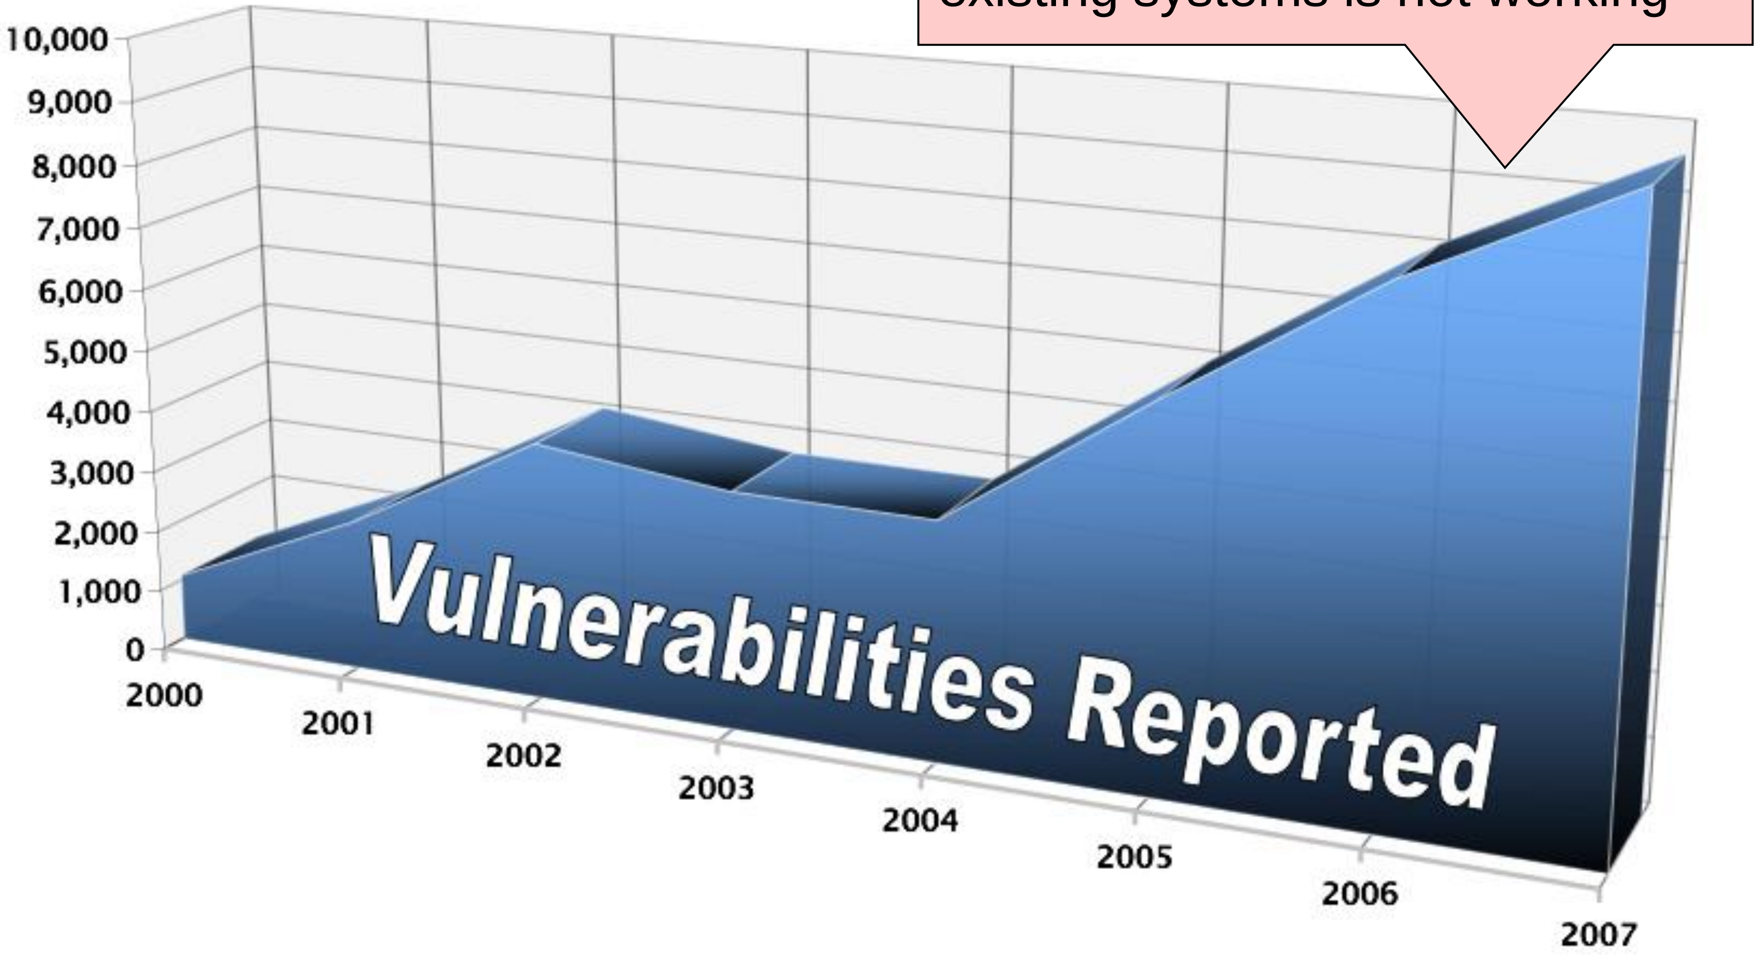


Secure Coding in the SDLC



Increasing Vulnerabilities

Reacting to vulnerabilities in existing systems is not working



CERT Secure Coding Initiative

Reduce the number of vulnerabilities to a level where they can be handled by computer security incident response teams (CSIRTs)

Decrease remediation costs by eliminating vulnerabilities *before* software is deployed

Poll

What programming languages is primarily used by your department / group / organization?

a) C

b) C++

c) Java

d) Scripting

e) Other

Fun With Integers

```
char x, y;
x = -128;
y = -x;
```

Lesson: Process is irrelevant without a strong fundamental knowledge of the language and environment

```
if (x == y) puts("1");
if ((x - y) == 0) puts("2");
if ((x + y) == 2 * x) puts("3");
if (((char)(-x) + x) != 0) puts("4");
if (x != -y) puts("5");
```

CERT Secure Coding Standards

Establish coding guidelines for commonly used programming languages that can be used to improve the security of software systems under development

Based on documented standard language versions as defined by official or de facto standards organizations

Secure coding standards are under development for:

- C programming language (ISO/IEC 9899:1999)
- C++ programming language (ISO/IEC 14882-2003)
- Java Platform Standard Edition 6

CERT Secure Coding Standards

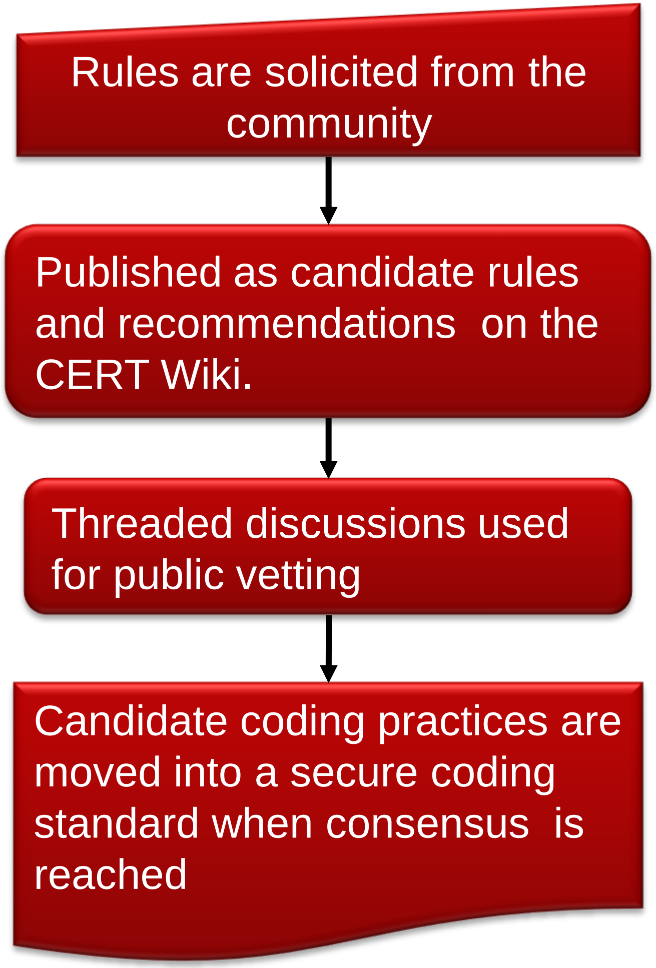
Added by Confluence Administrator , last edited by Robert Seacord on Sep 08, 2008 (view change)

Labels: (None) EDIT

Welcome to the Secure Coding Web Site

This web site exists to support the development of secure coding standards for commonly used programming languages such as C and C++. These standards are being developed through a broad-based community effort including the CERT Secure Coding Initiative and members of the software development and software security communities. For a further explanation of this project and tips on how to contribute, please see the Development Guidelines.

As this is a development web site, many of the pages are incomplete or contain errors. If you are interested in furthering this effort, you may comment on existing items or send recommendations to secure-coding at cert dot org. You may also apply for an account to directly edit content on the site. Before using this site, please familiarize yourself with the Terms and Conditions.



Rules are solicited from the community

Published as candidate rules and recommendations on the CERT Wiki.

Threaded discussions used for public vetting

Candidate coding practices are moved into a secure coding standard when consensus is reached

Noncompliant Examples & Compliant Solutions

Noncompliant Code Example

In this noncompliant code example, the **`char`** pointer **`p`** is initialized to the address of a string literal. Attempting to modify the string literal results in undefined behavior.

```
char *p = "string literal"; p[0] = 'S';
```

Compliant Solution

As an array initializer, a string literal specifies the initial values of characters in an array as well as the size of the array. This code creates a copy of the string literal in the space allocated to the character array **`a`**. The string stored in **`a`** can be safely modified.

```
char a[] = "string literal"; a[0] = 'S';
```

Microsoft Releases Security Bulletin Advance Notification for March

Microsoft has issued a Security Bulletin Advance Notification indicating that their March release cycle will contain no new Security Bulletins. They will, however, be releasing an updated version of the Microsoft Windows Malicious Software Removal Tool. The release is scheduled for Tuesday, March 13th.

US-CERT will provide additional information as it becomes available.

Mozilla Releases Security Advisory to Address Multiple Vulnerabilities

Mozilla has released Security Advisory 2007-09 to address vulnerabilities in Firefox and SeaMonkey.

STR35-C. Limit input when reading into a fixed length array - CERT Secure Coding Standards

https://www.securecoding.cert.org/confluence/display/cplusplus/STR35-C.+Limit+input+when+reading+into+a+fixed+length+array

CERT

Software Assurance | Secure Systems | Organizational Security | Coordinated Response | Training

Dashboard > C++ Secure Coding Practices > ... > 11. Null-Terminated Byte Strings (STR) > STR35-C. Limit input when reading into a fixed length array

STR35-C. Limit input when reading into a fixed length array

Limit input when reading from an unbounded input source into a fixed length array or other bounded storage location.

Non-Compliant Code Example

Inputting more than 11 characters into the following the C++ program results in an out-of-bounds write:

```
#include <iostream>

int main() {
  using namespace std;
  char buf[12];
  cin >> buf;
  cout << "echo: " << buf << endl;
}
```

Compliant Solution

The extraction operation can be limited to a specified number of characters if ios_base::width is set to a value > 0. In this compliant solution, the width field is set to the size of the buffer. In this particular example, this limits the number of characters read from stdin to 11 characters. The call to the extraction operator appends a null-termination character to the character array.

```
#include <iostream>

int main() {
  using namespace std;
  char buf[12];
  cin.width(12);
  cin >> buf;
  cout << "echo: " << buf << endl;
}
```

After a call to the extraction operation, the value of the width field is reset to 0.

Risk Assessment

Failure to comply with this rule could lead to buffer overflows and the execution of arbitrary code by an attacker.

Rule	Severity	Likelihood	Remediation Cost	Priority	Level
STR35-C	3 (high)	3 (likely)	3 (low)	P27	L1

CERT Secure Coding Standard

Examples of vulnerabilities resulting from the violation of this recommendation can be found on the CERT website .

Secure Coding Standard Applications

Establish secure coding practices within an organization

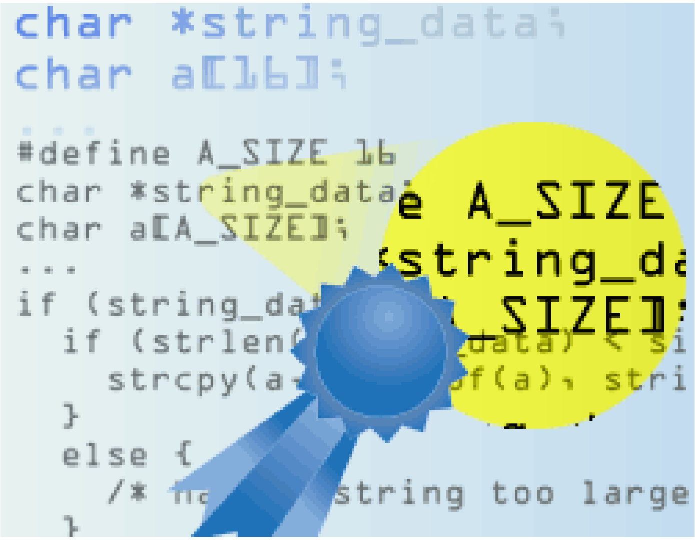
- may be extended with organization-specific rules
- cannot replace or remove existing rules

Train software professionals

Certify programmers in secure coding

Establish requirements for software analysis tools

Certify software systems



```
char *string_data;

Enforcing Coding Standards

Increasingly, application source code reviews are dictated.

The Payment Card Industry (PCI) Data Security Standard requires that companies with stored credit card or other consumer financial data

- install application firewalls around all Internet-facing applications or
- have all the applications' code reviewed for security flaws.

This requirement could be met by a manual review of application source code or the proper use of automated application source code analyzer tools.

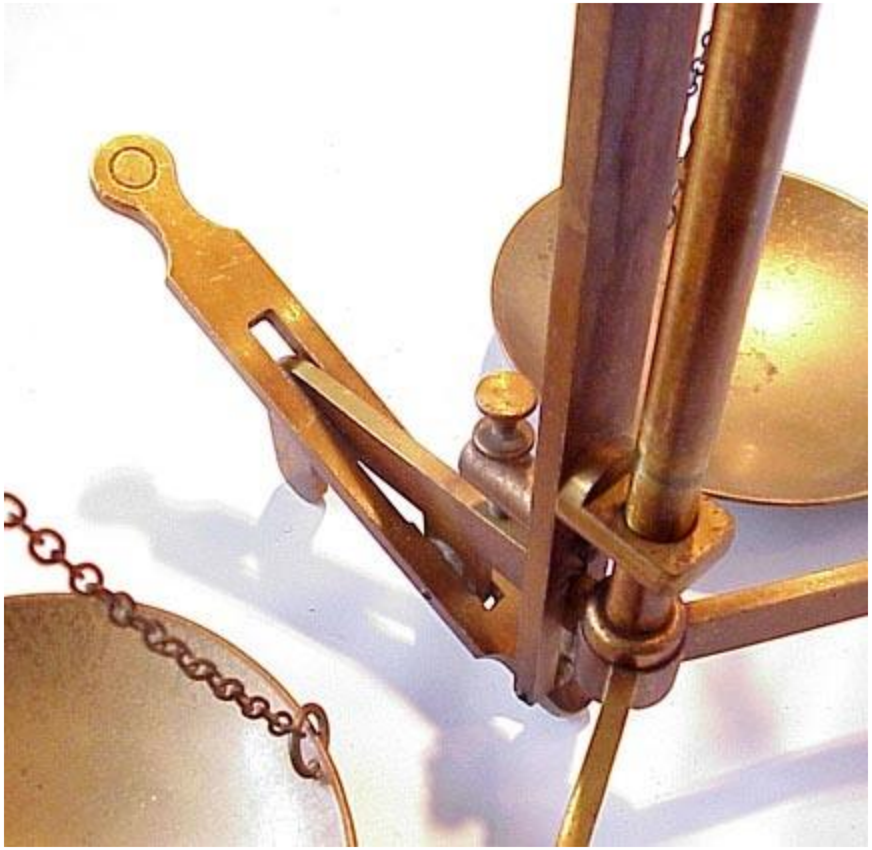
CERT SCALe (Source Code Analysis Lab)

Satisfy demand for source code assessments for both government and industry organizations.

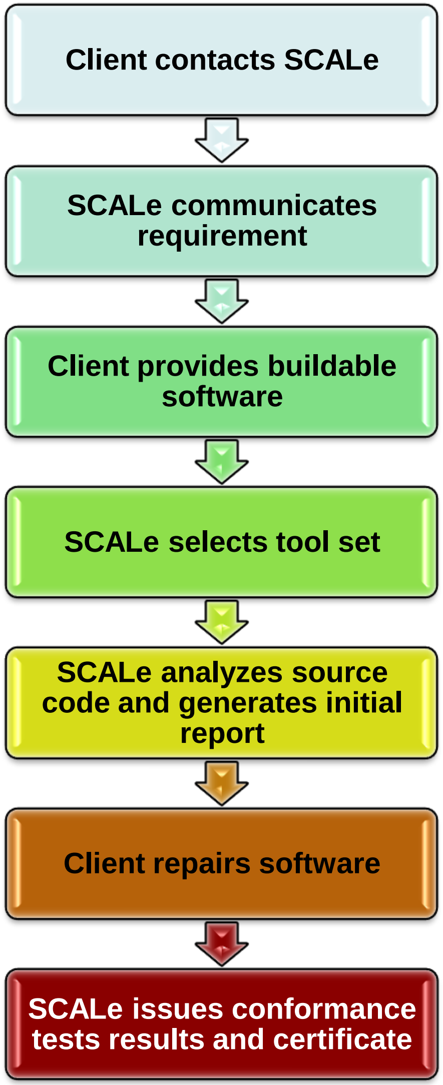
Assess source code against one or more secure coding standards.

Provided a detailed report of findings.

Assist customers in developing conforming systems.



Conformance Testing



Client contacts SCALe

SCALe communicates requirement

Client provides buildable software

SCALe selects tool set

SCALe analyzes source code and generates initial report

Client repairs software

SCALe issues conformance tests results and certificate

The use of secure coding standards defines a proscriptive set of rules and recommendations to which the source code can be evaluated for compliance.

Secure Coding in C/C++ Course

Four day course provides practical guidance on secure programming

- provides a detailed explanation of common programming errors
- describes how errors can lead to vulnerable code
- evaluates available mitigation strategies
- http://www.sei.cmu.edu/products/courses/p63.html

Useful to anyone involved in developing secure C and C++ programs regardless of the application

Direct offerings in Pittsburgh, Arlington, and other cities

Partnered with industry

- Licensed to Computer Associates to train 9000+ internal software developers
- Licensed to SANS to provide public training

CMU CS 15-392 Secure Programming

Offered as an undergraduate elective in the School of Computer Science in S07, S08 and S09

- More of a vocational course than an “enduring knowledge” course.
- Students are interested in taking a class that goes beyond “policy”

Secure Software Engineering graduate course offered at INI in F08, F09

Working with NSF to sponsor a workshop in Mauritius to help universities throughout the world teach secure coding

As-if Infinitely Ranged (AIR) Integers

AIR integers is a model for automating the elimination of integer overflow and truncation in C and C++ code.

- integer operations either succeed or trap
- uses the runtime-constraint handling mechanisms defined by ISO/IEC TR 24731-1
- generates constraint violations for
  - signed overflow for addition, subtraction, multiplication, negation, and left shifts
  - unsigned wrapping for addition, subtraction, and multiplication
  - truncation resulting from coercion (not included in benchmarks)

SPECINT2006 macro-benchmarks

Optimization Level	Control Ratio	Analyzable Ratio	% Slowdown
-O0	4.92	4.60	6.96
-O1	7.21	6.77	6.50
-O2	7.38	6.99	5.58

CERT C and C++

Develop a holistic solution to the problem that includes

- An analyzability annex for the C1X standard
- As-if infinitely ranged (“AIR”) integers
- Safe Secure C/C++ methods (SSCC)
- C and C++ Secure Coding Guidelines

This solution eliminates the vulnerabilities:

- Writing outside the bounds of an object (e.g., buffer overflow)
- Reading outside the bounds of an object
- Arbitrary reads/writes (e.g., wild-pointer stores)
- Integer overflow and truncation

Prototype using Compass/ROSE and GCC

Prototype Design
